Box Seat

The Box Seat is a high-strength, plastic device designed to eliminate the annoying and costly problem of having to re-dig a valve box base that has shifted off center during the backfilling process. The Box Seat is easily installed by removing the valve's operating nut and sliding it over the valve stem. When in place it automatically centers the valve box base around the operating nut and prevents the backfill material from interfering with valve operation while still allowing surface water to drain out. Any surface debris that does enter the valve box can quickly and easily be flushed out using air or water.

Handwheel For 2" Square Operating Nut

Operating nut protrudes above handlewheel

Handwheel with optional Revolving Speed Handle

The Handwheel is made of ductile iron for strength. The square head cap screw with cup point assures that the handwheel stays locked onto the operating nut. The raised lettering is 1/2" high minimum. The 2" square nut protrudes 3/4" above the handwheel top surface which provides the option of using a Standard Gate Wrench. An optional 3/4" speed handle is available for valve exercising.
